

LVS Small Plastic Parts Produce Two and a Half Millionth Speaker Bezel

In July 2013, the first shots came off a machine producing a new design of automotive speaker bezels at Telford based LVS Small Plastic Parts. As is often the case, the 'high end' Automotive Company in question quickly surpassed expected production volumes and also launched new models that utilised the same components.

Speaker Bezels pre-plating

With six bezels being fitted to each vehicle, the machine in question has since only come out of production to allow the company to carry the occasional tool modification resulting from design changes, or for routine tool maintenance. The latter is particularly critical in this case due to these 'A-Face' components being plated, any imperfections being highlighted by this process.

LVS SPP are however no stranger to high production runs, a good example being a product for the catering industry that has been in production since January 2002 at a rate of 90,000 units per week for 50 weeks per year. That's an astonishing **69,000,000** mouldings and counting.
